Activity 1: Install a web server and use remote terminal

1. Install VMware Workstation 11 for Windows or VMware Player 6, if you haven't previously.

2. Review the system requirements for Ubuntu Server.

3. Create a new virtual machine, using appropriate hard drive and memory requirements, and (using it) install Ubuntu Server 14.04.x LTS.

4. Install packages to enable the server to provide the following functional services:

   a. OpenSSH

   b. Apache2 web server

5. From the host computer, use PuTTY to connect to the guest computer.

6. From the host computer, use a web browser to load the Apache default web page.
