

Activity 4: Configure HTTP Virtual Hosts

1. Configure two (2) HTTP virtual hosts on the Ubuntu server:
 - `www.mscisrocks.com`
 - `www.lovinlinux.com`
2. Create a simple `index.html` file for each site that includes the site's name.
3. In a browser on the host computer, load each site.
4. Create two new users to administer the virtual hosts.
5. Modify the home directory of each user such that: one user's home directory is the folder for virtual host #1, and the other user's home directory is the folder for virtual host #2.
6. Change ownership so each user owns their new home directory.
7. Test each user account using FTP.
